

Delta Engineers, Architects, & Land Surveyors, P.C.

Providing our engineers with professional growth through education

*Delta's Mechanical Department
We are a seamless extension of our clients' organizations*

Delta Engineers, Architects, & Land Surveyors, PC

Julius Caesar once said that “experience is the best teacher”. Experience alone, however, does not make a great engineer. An engineer must have a good foundation to build upon if he or she is to become that great engineer. This involves a thorough understanding of basic engineering principles and the design methods to apply in their particular discipline. An engineer must also continually keep up with, and understand, the most current technological changes in his or her field since technology literally changes daily. Experience then becomes the ingredient that ties everything together because it enhances the engineer’s understanding of basic principles and it greatly increases his or her ability to apply new methods and technology to different, complex, and challenging situations.

In order to establish a good technical foundation for our engineers, Delta has committed to providing a thorough training program for all of our staff. One such example is in our mechanical department. All mechanical engineers are given a design applications notebook; provided training in the application of heat transfer, thermodynamics, fluid mechanics, and psychrometrics; in house technical seminars are provided regularly by vendors; are encouraged to attend webinars or technical seminars in their discipline, and work with a senior staff member (mentor) on a daily basis. Delta understands that both knowledge and experience are the key ingredients needed to provide our engineers with the tools to design a successful project and to grow professionally.

If a building’s mechanical system is to function and operate efficiently, it must be built on a good foundation. Before the building is constructed, it must be designed by engineers who possess the knowledge and experience to successfully design the building which meets and exceeds the owner’s needs. Delta has found that fostering an environment in which we encourage advancement through education and knowledge through mentoring allows us to provide our clients with the next generation of great engineers.

Delta provides professional growth opportunities to all of our staff by providing them with in-house courses, reimbursement of the cost of additional schooling and professional license exams and certifications, as well as the study guides. Delta’s current openings can be found on our website: www.deltaengineers.com.
